TITLE: Method, system and computer program product for internet-enabled, patient monitoring system

Detail Description Paragraph:

[0180] It is therefore an object of the present invention to translate complex, real-time medical data recorded from a medical outpatient and stored in a database into a sequential series of automated, real-time messages, broadcast over time to a communication device possessed by the patient's designated family member and/or caregiver. The messages may be presented in textual, graphical, pictorial, or voice formats. The messages may include raw patient data, or reports that are easy and quickly understood. The communication device may be remotely located from the patient and/or database, facilitating mobile information transfer, or be located adjacent to the patient and/or database.

Detail Description Paragraph:

[0301] Any technology that interacts with patients and physicians, capable of communicating by modem, fax, phone line or wireless means may be used to present the streaming media and other types of advertisements, and collect the patient data that is communicated to the database for storage and for display. This technology may include Personal Digital Assistants (PDAs), Personal Computers (PCs), interactive televisions, the Palm Pilot.RTM., laptop computers, wireless devices, and "smart phones." Among the interactive devices is the Medi-Monitor.RTM. described in PCT patent application W098/38909 herein incorporated by reference. The database containing the advertising content, patient information, physician information, and protocols may also be the site of the medical and economic data, prescribing patterns data and the sales data, used by the methods of the present invention.

Detail Description Paragraph:

[0326] Any technology that interacts with patients and physicians, capable of communicating by modem, fax, phone line or wireless means may be used to present the streaming media and other types of advertisements that are part of the positioning and branding of the drugs, and collect the patient data that is communicated to the database for storage and for display. This technology may include Personal Digital Assistants (PDAs), Personal Computers (PCs), interactive televisions, the Palm Pilot.RTM., laptop computers, wireless devices, and "smart phones." Among the interactive devices is the Medi-Monitor.RTM. described in PCT patent application W098/38909 herein incorporated by reference. The database containing the advertising content, patient information, physician information, and protocols may also be the site of the medical and economic data, side effects data, adverse drug events data, drug interaction data, prescribing patterns data and the sales data, used by the methods of the present invention.

Detail Description Paragraph:

[0389] The patient data elements related to the icons displayed on the remote patient device, in one embodiment as illustrated in FIG. 29 or the pre-approved voice prompts may relate to instructions or medical educational content about

specific medication; medication dosage; patient physiological measurement, for example weight, blood pressure, pulse rate, glucose level, any antigen level, pH, pO₂, temperature, EKG rhythm, pO₂ saturation of the blood, hormone level; any psychological measurement, for example the score based upon standardized or non-standardized tests measuring anxiety, stress, anger, suicidal tendencies, schizophrenic relapse, rapid cycling bipolar relapse or confusion; medical education content related to any disease state or medical condition, for example congestive heart failure, hypertension, angina, circulatory inadequacy or other disease condition of the cardiopulmonary and circulatory systems, specific organ failure, dysfunction of an organ or system or transplanted organ such as asthma for the lungs, kidney failure for the kidney, arteriosclerosis or atherosclerosis of the heart, and transplantation of lung, kidney or heart; class of pathogen, or a specific pathogen; for example instructions or content may be based upon viral infection, or upon a specific viral disease such as HIV/AIDS, hepatitis A,B,C,D,E or G. Similarly, the data elements may be based upon a bacterial disease agent, for example tuberculosis, malaria, cholera and meningitis; a specific microbial agent such as a virus, bacteria, mycotic infection and parasitic infection; or may be based upon the type of pathology involved or the physiological system effected; for example cancer, autoimmune disease, muscular-skeletal system, or pathology of the hematopoietic, circulatory, reproductive, digestive, endocrine or nervous systems.
